## DISTEC's New Walk-In Light Box System The most attractive solution for health & safety at work

DISTEC has always been keen to advance product developments constantly, not only with regards to design and performance but also concerning health and safety for the service personnel.

Already in March 2007 we presented our first 48-sheet Walk-In Light Box which we installed for Clear Channel in London, UK.

The success of this box did not make us rest on our laurels.

Instead, it has been a motivation and has become the mainspring to work on an even optimized version which we are proud to present now.

Sizes range from 46-sheet (6x3m) to 96-sheet (12x3m) and other megaformats.

As a standard, the entry door is on the left hand side of the unit. If preferred to have it on the right side, this can easily be reversed during assembly. The entry side is equipped with a ladder support as a safety feature, and of course the door is secured with a lock and is provided with a hold-open latch to prevent it from closing while you are entering the unit.

DISTEC's Walk-In Light Box holds the weight of three service persons standing inside the unit and it is designed in line with UK „Health & Safety“ working requirements, including a non-slip surface inside, a safety harness for the workers etc.

The Walk-In Light box creates a really safe working environment.

### Topic:

DISTEC's Walk-In Light Box 2009

On top of the safety issues, DISTEC's Walk-In Light Box makes service and maintenance easy and effective:

- Access to the unit is quick
- Components are durable
- Posters are tensioned by a lower rail system and a lateral swing-arm system
- Posters are connected to each side by keder

The advantages of the new 2009 version of the DISTEC Walk-In Light Box are obvious:

Have a look at the pictures and you will see that the box looks rather slim with a very contemporary and attractive shape.

Last but not least the Walk-In 2009 is a modular system and is available at very attractive prices. Please contact us !

Always at the pulse of time, DISTEC has even turned it up a notch: We have equipped our Walk-In Light Box 2009 with our „enblue“ power LED-tubes, double-sided, with a beam angle of 2 x 120°, thus combining a nice and pane illumination with valuable savings in energy and CO<sup>2</sup> emission as well as an extended product life. For further details, please check out under [www.enbluetec.com](http://www.enbluetec.com).
